* NOTE: This record contains 87 individual

* sequencing reads that have not been assembled into

* contigs. Runs of N are used to separate the reads

* and the order in which they appear is completely

* arbitrary. Low-pass sequence sampling is useful for

* identifying clones that may be gene-rich and allows

* overlap relationships among clones to be deduced.

* However, it should not be assumed that this clone

* will be sequenced to completion. In the event that

* the record is updated, the accession number will
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Mammalia;

On Aug 26, 1999 this sequence version replaced gi:5763790.

This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AC017563

                                                                                                                                                                                                                                                                                                                                                                                                                       HSRYR7CC1 119118 bp DNA PRI 12-DEC-1999
Human DNA sequence from clone XX-PRYR7CC1 on chromosome 22 Contains an STS, GSSs, genomic marker D22S928, tc and ca repeat polymorphisms and a putative CpG island, complete sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence was identified as CDM:10211270 by the submitter. For more information on this record e-mail to fly@celera.com.
* NOTE: This is a 'working draft' sequence.
* This sequence will be replaced
* the finished sequence as soon as it is available and
* the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em:, SWISSPROT; Tr., TREMBL; Wp:, WORMPEP; Information
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       http://www.sanger.ac.uk/Projects/C_elegans/wormpep IMPORTANT: This sequence is not the entire insert of clone X-PRXR7CC1 It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The true left end of clone XX-PRYR7CC1 is at 1 in this sequence. The true left end of clone CTA-217C2 is at 119019 in this sequen The true right end of clone RP4-753M9 is at 50597 in this sequen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; on the WORMPEP database can be found at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        human chromosome 22, constructed by the Sanger Centre Chromosome Mapping Group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     NOTE: This is a 'working draft' sequence. It currently consists of 25 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            2 tggattgtcagctctccatcctccttctcagctgctctgttctcgacagcttcgggg 61
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Submitted (29-Nov-1999) Sanger Centre, Hinxton, Cambridgeshire, CB10 1SA, UK. E-mail enquiries: humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk
On Nov 29, 1999 this sequence version replaced gi:6468554.
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the feature key
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   GGCTGAATCC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               44;
                                                                                                                                                                                                                The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:
Em:, EMBL; Sw:, SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 6, constructed by the Sanger Centre Chromosome 6 Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/Chr6
RP1-72EL7 is from the library RPCI-1 constructed at the Roswell Park Cancer Institute by the group of Pleter de Jong. For further details see http://bacpac.med.buffalo.edu/
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.

It currently consists of 44 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     NOTE: This is a 'working draft' sequence. It currently consists of 59 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

Probes derived from the EPH-related PPKs Cek4 (Q90659) and Cek5 (Q90660) were used to isolate novel cDNA clones (Q90652-58, Q90661-62) from chicken embryo and embryonic brain libraries. Cek4 is highly expressed in the chicken developing brain and embryonic tissues, as well as in the adult brain and retina. Sequence 3254 BP; 926 A; 737 C; 796 G; 795 T;

Claim 1; Page 66-72; 133pp; English.

CONAS (T02946-49) coding for 4 novel human EPH-like receptor protein tyrosine kinases; HEX5, HEX7, HEX8 and HEX11 (R85089-92), respectively, were isolated from a human foetal brain cDNA library using a directed PCR approach with primers (see T02960-61) based on conserved regions of receptor PTKs and EPH-like receptor PTKs. HEX5, HEX7 and HEX8 show extensive homology to the catalytic domain of chicken EPH-like receptors. Cek5, Cek7 and Cek8. HEX11 shows no homology to any known EPH-like receptor. The isolated cDNAs are used for prodn. of recombinant HEKS and chimeric receptors, in hybridisation assays, and

         AL-1 neurotrophic factor, an eph-tyrosine kinase ligand - used in treatment and diagnosis of neuronal disorders and angiogenesis-related conditions.

Example 1: Page 47-49; 75pp: English.

A cDNA clone (T18893) codes for rat REK7 (R97853), an eph-related tyrosine kinase receptor, for which AL-1 (see also W97854) is a ligand. It was isolated using degenerate receptor tyrosine kinase primers (T18894-96) to amplify cDNAs of an adult mouse hippocampal cDNA library. A PCR fragment was used as a probe to isolate the full-length REK7 cDNA from a rat hippocampal cDNA library. An a rat hippocampal cDNA library. An constant of the constant contains the contains

                                                          Example 1; Page 115-116; 128pp; English.

EXAMPLE 1; Page 115-116; 128pp; English.

EDNA cloning using adult mouse brains and MDK1 T2 (T32962), that coded for truncated versions (W03423 and W03423, respectively) of the novel mouse developmental kinase 1 (MDK1) (see also T32960), a new member of the eck/eph family of receptor tyrosine kinases.

MDK T1 and T2 each possess the entire ectodomain, the transmembrane domain and part of the juxtamembrane region of MDK1 (see also W03421), but lack the catalytic tyrosine kinase domain. They may have a modulatory function. The CDNA clones can be used to produce MDK1 T1 and T2, which are useful for screening potential agents for treatment of diseases characterised by abnormal signal transduction.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Example 1; Page 111-12; 128pp; English.

CDNA cloning using adult mouse brains and Morthern blotting identified 2 clones, MDK1 T1 (T32961) and MDK1 T2 (T32962), that coded for truncated versions (M03422 and M03423, respectively) of the novel mouse developmental kinase 1 (MDK1) (see also T32960), a new member of the eck/eph family of receptor tyrosine kinases.

MDK T1 and T2 each possess the entire ectodomain, the transmembrane domain and part of the juxtamembrane region of MDK1 (see also W03421), but lack the catalytic tyrosine kinase domain. They may have a modulatory function. The cDNA clones can be used to produce MDK1 T1 and T2, which are useful for screening potential agents for treatment of diseases characterised by abnormal signal transduction.
